AutoCAD [Latest 2022]

The first version of AutoCAD, designed for small-scale mechanical drafting, was released in 1988 as a desktop app for MS-DOS PCs. AutoCAD soon found its way into other parts of the architecture, transportation, construction, and civil engineering industries. From its beginning, AutoCAD emphasized ease of use. Its user interface was redesigned to work with common, mouse-driven operating systems. In 1988, version 1.0 was the first CAD product to offer complete parametric modeling. AutoCAD remains one of the world's most widely used commercial CAD programs. A type of linear scaling problem The linear scaling problem is a common one in CAD, and is the basis of all engineering drawing. The problem is when a feature, such as a line, is scaled by a factor such as four, with no simultaneous scaling of the distances between features. The most common cause of this is when a line is being rotated without the angle of the line being scaled. When the line is scaled, its length remains the same. However, the distances between points along the line will be stretched by the same factor as the line itself. For example, if a line is 10 units in length, and then scaled by a factor of four, it will now be 40 units in length. This same linear scaling affects the distances between features on the line. If the angle of the line is not scaled, then the distances between points will be stretched by the same amount as the line itself. To avoid linear scaling, it's necessary to keep the line angle the same when scaling, or change the length of the line. However, if the scaling factor is simply changed to 4, for example, then scaling will be achieved by stretching the distances between features rather than the features themselves. This is what the problem is with linear scaling. The problem is only exacerbated when the line is scaled, because when the line is rotated, the distance between features can be lengthened, but the distance between features along the same line will remain the same. For example, if a line is rotated by 180 degrees, and then scaled by 4, the distances between features will be stretched by 4, but the distances between features that were at the same location along the line will not have been stretched. In order to solve the linear scaling problem, it's necessary to keep the line angle the same, and scale the distance between features rather than the features themselves. The best way to do this is by keeping the
